Test Case Specification

September 29th, 2025
Ana Paiva, Auri Vincenzi, José Campos

In this recitation class, we will design test cases based on textual requirements.

1. Consider the function `div(a, b)` that divides two integers

1.a) Define test conditions for testing the `div` function.
1.b) Define test cases for testing those test conditions.

2. Consider the function `sort`, which gets a list `L` of integers and returns that list sorted in ascending order

2.a) Define test conditions for testing the `sort` function.
2.b) Define test cases for testing those test conditions.

3. For testing the login functionality of a service, we have identified the following test conditions:

(Please download the 1. Test Case Specification Template.docx file to solve this Exercise)

i. Correct login (existing user; correct login; and correct password)
ii. Incorrect login
1. Existing user, but incorrect password
2. Incorrect login with account blocking (entering the wrong password three times, which should result in the blocking of the account)
3. Non-existent user

3.a) Define test cases for testing the test conditions ii.1, ii.2 and ii.3.

4. [Additional] Consider the function `triangle(A, B, C)`

The values `A`, `B`, and `C` represent the length of the sides of a triangle. The function prints a message that states whether the triangle is
- scalene (all lengths are different),
- isosceles (two lengths are equal),
- equilateral (all lengths are equal),
- or an error (the parameters do not form a triangle)

Restriction among parameters:

```
A, B, and C integers
A > 0, B > 0, C > 0
```

```
A < B + C, B < A + C, C < A + B
```

4.a) Define test conditions for testing the `triangle` function.
4.b) Define test cases for testing those test conditions.
